

Prompts for the ai roast generator

1)

Write a professional Cpp application called "AI Roast Generator".

2) Requirements:

- 3) 1. Take user input for the person's name.
- 4) 2. Store at least 10 funny roast templates in a vector.
- 5) 3. Use randomization so that a different roast appears each time.
- 6) 4. Replace the name with the actual user name.
- 7) 5. Use functions and proper class-based structure.
- 8) 6. Add beginner-friendly comments.
- 9) 7. Use clean formatting and professional coding style.
- 10) 8. Handle invalid or empty input properly.
- 11) 9. Display the roast in a clean UI format using console output.
- 12) 10. Allow the user to generate multiple roasts without restarting the program.

2)

Improve the previous C++ roast generator program.

Requirements:

1. Convert the logic into a separate class named "AI Roast Generator".
2. Use private and public access specifiers properly.
3. Create a dedicated function for placeholder replacement.
4. Improve naming conventions for variables and functions.
5. Make the program look more professional and modular.
6. Keep the code readable and optimized for beginners.

3).

Generate more creative and funny roast templates for a C++ AI roast generator project.

Conditions:

1. Roasts should be clean and non-offensive.
2. Use the name.
3. Roasts should be coding and student related.
4. Make them sound modern and humorous.
5. Generate at least 15 roast templates.

4) .

The program crashes or behaves incorrectly when the user presses Enter without typing a name.

Fix the issue by:

1. Detecting empty input.
2. Showing an error message.
3. Preventing the roast generator from continuing with invalid input.
4. Keep the code structure professional.

5).

Improve the random roast generation logic in the C++ program so the output feels more dynamic and less repetitive.

Requirements:

1. Use proper random seeding.
2. Ensure different roasts appear on different runs.
3. Keep the code beginner-friendly.
4. Maintain performance and readability.
